

Cleaning Equipment Brushes, Jags & Patches

Proof Positive Jags

All V-Stix utilize an enhanced steel core resulting in a ridged rod that minimizes bow and flex.

The steel core is coated with a high performance, uniform covering that is extremely chemically resistant and durable. The coating does not soften allowing bore debris to embed and so does not peel or scratch.

All of our V-stix come with a proof positive end which means that there is not a brass tip on the rod. By eliminating the brass tip one can determine when a rifle bore is truly copper free reducing wasted patches, chemical and cleaning time.

(When used in conjunction with our Proof positive Jags & Brushes)

Nylon Rifle Brush

Proof positive Nylon Brushes have twice the amount of bristles compared to the competition, resulting in double the scrubbing action and faster cleaning. These brushes feature oversized bristles for extra rigidity and non brass cores and couples which prevent the false indication of copper fouling remaining in your bore

Patches

Our patches are the highest quality, 100% cotton flannel, double napped (on both sides), non fraying patches money can buy. These patches offer the maximum solvent absorption and cleaning capabilities possible.

Patches are packed in re-sealable plastic bags for convenience
